1. Introduction and Aims .............................................. 1

2. Methods .......................................................... 5
   2.1 Field sampling – Stitt River ................................ 5
   2.2 Field sampling – Lake Pieman .............................. 7
   2.3 Data analysis ................................................. 11

3. Results: Stitt River ............................................... 12
   3.1 Macroinvertebrates ........................................... 12
   3.2 Stitt River – Habitat conditions ........................... 16
   3.3 Stitt River – Vertebrates .................................... 16

4. Results Lake Pieman ............................................. 19
   4.1 Algae ............................................................ 19
   4.2 Macroinvertebrates .......................................... 21

5. Overall Biological Condition ................................. 26
   5.1 Stitt River ...................................................... 26
   5.2 Lake Pieman .................................................. 26

6. References ......................................................... 27
1. Introduction and Aims

This report describes the results of a freshwater biological survey conducted in autumn 2013 in the Stitt River and Lake Pieman.

The primary aims of this monitoring are to:

- describe the status of macroinvertebrate and fish assemblages in the lower Stitt Rivers, as they pertain to the future discharge of a proposed TasWater wastewater treatment;
- describe the ecological status of lake shore habitats of Lake Pieman, as they relate to the possible effect of the proposed new TasWater wastewater treatment plant on the discharge of the Stitt River into the Lake.
