

20/1/69

Herewith, dear Dr Story, I return the list of the names of the plants you so very kindly sent You will find them all named according to our latest observations.

The beautiful supply of Anthocercis Tasmania and of the Helichrysum lycopodioides pleased me very much –

You have again shown new localities for rare plants.

Among the ^fresh^ water plants you will find doubtless yet many hither to overlooked. Even the smallest and most insignificant of them will be welcome

Trusting you will continue your most valuable communications I remain your regardful

Furd Von Mueller

[Page break]

The little ~~Geranium~~ creeping plant named Geranium N. 4
seems to me

Veronica Plebiya

However flowers & fruits are wanting!

Leucopogon collinus Br occurs in your collections without number - It is near Z. ericoides [?]

I would advise to adopt simply a current number for all your plants. You will find that such numbers will aid us both with the greatest facility

[page break]

Geranium N. 4

is Veronica Plebeya H.^r & fr^d. wants [?] Leucopogon Collinus
