

**New tools for determining incidence and severity of  
Mycosphaerella Leaf Disease in Eucalypt plantations.**

Elizabeth Pietrzykowski

B.Sc. Forest Ecology. (Hons.)

University of Tasmania

Submitted in fulfilment of the requirements for the degree of

Doctor of Philosophy

School of Agricultural Science, CRC For Forestry and

University of Tasmania 2007.

For Mum and Dad  
who gave me the opportunity to go to University.

## Acknowledgments

---

I owe many thanks to Drs Caroline Mohammed (University of Tasmania), Libby Pinkard (CRC For Forestry) and Christine Stone (Forest Health Management, NSW Department of Primary Industry). Without their advice and teaching this thesis would never have been completed.

Thank you to Dr Neil Sims and Dr Darius Culvenor, members of the Remote Sensing group of ENSIS, Clayton. Guidance they provided in relation to the remote sensing part of this work has been invaluable.

For help with statistics I would like to thank Dr David Ratkowsky (University of Tasmania), Dr Amrit Kathuria (State Forests of New South Wales), Dr Scott Foster (Tasmanian Institute of Agricultural Research) and Dr Luke Rapley (University of Tasmania).

Thanks to Forestry Tasmania for the use of their plantations, field personal and access to their GIS database. Thanks to Dr Timothy Wardlaw, Karl Wotherspoon, Nita Ramsden, Andy Muirhead and Sue Jennings for technical assistance.

Thanks to my mentors and friends Clare McArthur, Adrian Goodwin, Libby Pinkard and Michael Battaglia. Without their distractions of climbing, running and assorted multi-sporting I might well have finished this thesis six months earlier! I also thank you for your honesty regarding my work and getting through troublesome times.

Thanks also to my fellow comrade Anna Smith. The number of adventures we have endured will never be forgotten. Additional people I wish to thank are: Brett Appleby (Minkin), Lou Cromer, Heike Mumford, Luke Rapley, Carla Wolbang, Anna Hopkins, Edwin Darke, Sarah Bishop, Lynden Radcliff, Belinda Gleeson, Craig Baillie, Karen Barry, Karina Potter, Jan Ellis and Linda Ballard. Collectively these people have been a great support network and made the last four years pleasurable.

Finally, and mostly importantly I wish to thank my wonderfully supportive family, Bozena, Bartek, Dominik and Amy Pietrzykowski. These people gave me love, support and food when times were tough. Thank you.

## Abstract

---

Plantation forests are susceptible to many pests, which can reduce the quality and value of the wood products they source. Certain species of the fungal genus *Mycosphaerella* are a concern in eucalyptus plantations around the world. *Mycosphaerella* leaf disease (referred to as MLD from here in) can cause significant leaf necrosis, discolouration and defoliation. In Australia severe outbreaks of MLD have been observed in various eucalyptus plantations. The three aspects of MLD research targeted in this Thesis were factors influencing its atmospheric ascospore concentrations, the effect of its symptoms on leaf spectral properties, and the use of remote sensing to detect MLD's symptom distribution and severity.

Research into establishing the conditions required for high-risk infection periods in eucalyptus plantation forestry has been limited to a few studies that lack sufficient detail required for building a forecasting system. In this Thesis data from the ascospore trapping of *Mycosphaerella* ascospores in a juvenile *Eucalyptus globulus* Labill. plantation in northwest Tasmania indicated the presence of diurnal periodicities in ascospore densities. The meteorological variables influencing the pattern of atmospheric ascospore presence and absence were defined in terms of rainfall events, ambient temperature and relative humidity. The interactions of climatic variables and ascospore density with tree age were also investigated. The patterns of atmospheric ascospores over time indicated a higher probability of

observing ascospores when trees in the plantation were younger, however, the density of the ascospore event was likely to be small. As trees in the plantation became older this pattern was reversed. Mathematical functions were applied to describe the patterns identified. These were used to predict the probability and density of an ascospore event, both excluding and including meteorological data. The prototype predictive ascospore model is the first model developed for a disease in eucalyptus plantations, but requires validation at other sites, locations and years before adoption by the plantation forest industry.

The use of remote sensing (referred to as RS from here in) technologies for the evaluation of crown health in eucalyptus plantations will be a future option for forest managers as technologies improve and become cost effective for use in forestry. RS should offer assessment methodology and digitised data that is precise, non-subjective, providing to be integrated with existing geographical information systems (GIS) for further analysis and spatial modelling.

One step on the path towards developing successful RS forest health surveillance is robust spectral reflectance analysis of leaves from stressed and healthy tree crowns. The spectral reflectance response of foliage along the electromagnetic wavelength has a number of distinct features that can help characterise the symptoms of a fungal infection, such as *Mycosphaerella* leaf disease. Spectral reflectance measurements were made on healthy and diseased *E. globulus* foliage in the visible and near-infrared wavelengths (400 - 1000 nm). The wavelength most sensitive to infection severity was *R678* nm. The wavelengths near *R708* nm and *R550* nm appeared relatively insensitive to disease severity. The reflectance index best correlated to leaf severity

was  $R678/R550$  ( $r = 0.841$ ,  $P < 0.001$ ). This index was used in a linear regression model for predicting disease severity of leaves from an independent data set ( $r = 0.95$ ,  $P < 0.0001$ ). This work was used to identify potential spectral algorithms for testing remotely at the canopy scale.

Digital multi-spectral imagery (DMSI) was acquired over an *E. globulus* plantation in northwest Tasmania. The DMSI data together with ground based crown measurements of severity were used to develop regression models to predict MLD injury at the crown scale. A model was produced for defoliation and another for crown necrosis. The spatial distribution of symptoms was accurately represented by the maps derived from the RS imagery, and clearly showed where crown defoliation and necrosis were most severe. The results show that a post-stress assessment of eucalyptus health is possible at a plantation scale using remote sensing technology. With successful independent verification of the methods that were developed, this technology could be applied operationally to survey and assess plantation health.

This work represents the first attempt at developing models suitable for decision support software relevant to pest and disease management in eucalyptus plantations. The models will help guide intervention systems through specialized monitoring and disease warning systems, providing managers time to intervene before high levels of damage are incurred.

## Preface

---

This PhD Thesis is composed of 3 papers (which have been either published, submitted or in preparation), two additional chapters and four appendices. Please note that some repetition does occur throughout the Thesis, e.g. study site details. To improve the flow of the Thesis the following changes have been made:

- References have been compiled into a single list at the end of the Thesis,
- Acknowledgements for each publication are listed separately (see below),
- Figures and tables have been renumbered according to the chapter,
- Additional information that was not originally a part of the papers but considered important to the Thesis have been included as appendices.

### Publications arising from this Thesis include:

**E. Pietrzykowski, C. Stone, E. Pinkard, C. Mohammed.** (2006). Effects of *Mycosphaerella* leaf disease on the spectral reflectance properties of juvenile *Eucalyptus globulus* foliage. *Forest Pathology* 36: 334-348.

Acknowledgments: We are grateful for assistance from Dr. Timothy Wardlaw and staff of Forestry Tasmania. Thanks to Michael Stanford, formerly of CSIRO Forestry and Forest Products, for assistance with field spectroradiometer measurements and to Drs. Neil Sims and Karen Barry for their comments on the manuscript. The first author is funded by an Australian Postgraduate Award.

**Pietrzykowski, E., Sims, N., Stone, C., Pinkard, L., Mohammed, C.** (2006). Mapping *Mycosphaerella* leaf disease severity in a *Eucalyptus globulus* plantation using Digital Multi-Spectral Imagery. *Southern Hemisphere Forestry Journal*. In press.

We are grateful to Forestry Tasmania for the use of their plantation in this study. Thanks to Timothy Wardlaw, Andy Muirhead, Malcolm Hall, Anna Smith and Caroline Mohammed for their help with field work. Thanks to SpecTerra Services for taking the digital multispectral image of the plantation and to Neil Sims and Darius Culvenor (ENSIS, formally CSIRO Forestry and Forest Products) for their advice on methodology for the study.

**Pietrzykowski, E., Foster, S., Pinkard, L., Mohammed, C.** (2006). *Mycosphaerella* leaf disease atmospheric spore concentration patterns and the affect of meteorological variables in a *Eucalyptus globulus* plantation. In preparation.

Acknowledgements: The authors thank Forestry Tasmania for the use of their plantation in this study. Thanks to Sue Jennings from Forestry Tasmania for her weekly assistance with changing the spore trap.

Prizes:

15<sup>th</sup> Biennial Australasian Plant Pathology Conference 2005-Winner of the best student poster in the section titled “Innovations for sustainable plant health”.

## Table of Contents

---

Declarations.....	I
Acknowledgments.....	II
Abstract.....	IV
Preface.....	VII
Table of Contents.....	X

### Chapter 1.

1.1 Background.....	1
1.2 <i>Eucalyptus</i> plantation pests and their damage symptoms.....	3
1.3 <i>Mycosphaerella</i> Leaf Disease.....	5
1.4 <i>Mycosphaerella</i> Leaf Disease impact on eucalypts.....	6
1.5 MLD Epidemiology.....	8
1.6 Forecasting and determining the risk of MLD outbreaks.....	12
1.7 Assessment methods.....	16
1.8 Remote sensing.....	18
1.9 Research overview.....	20
1.9.1 Scope.....	20
1.9.2 Hypothesis.....	21
1.9.3 Objectives and summary of work.....	21

### Chapter 2.

Atmospheric ascospore concentrations of *Mycosphaerella* Leaf Disease in a  
*Eucalyptus globulus* plantation.

2.1 Introduction.....	25
2.2 Methods.....	28
2.2.1 Study site.....	28
2.2.2 Data.....	30
2.2.3 Data analysis.....	34
2.3 Results.....	36
2.3.1 Ascospore counting method.....	36

2.3.2 Investigation of seasonal and diurnal patterns in ascospore density	36
2.3.3 Effects of meteorological variables on ascospore density.....	43
2.3.4 Mathematical description of ascospore density periodicities.....	45
2.3.5 Observed versus predicted ascospore periodicities.....	57
2.4 Discussion.....	62
2.4.1 Epidemiology.....	62
2.4.2 Predictive model development.....	69

### Chapter 3.

Effects of *Mycosphaerella* Leaf Disease on the spectral reflectance properties of juvenile *Eucalyptus globulus* foliage.

3.1 Introduction.....	74
3.2 Methods.....	77
3.2.1 Study Site.....	77
3.2.2 Leaf sampling.....	78
3.2.3 Spectral measurements.....	81
3.2.4 Chlorophyll measurements.....	82
3.2.5 Data analysis.....	82
3.2.5.1 Model development and validation.....	86
3.3 Results.....	86
3.3.1 Influence of leaf disease severity on leaf reflectance spectra.....	86
3.3.2 Regression model and validation.....	95
3.4 Discussion.....	97

### Chapter 4.

Predicting *Mycosphaerella* leaf disease severity in a *Eucalyptus globulus* plantation using Digital Multi-Spectral Imagery.

4.1 Introduction.....	101
4.2 Methods.....	104
4.2.1 Study site.....	104
4.2.2 Assessment of <i>Mycosphaerella</i> Leaf Disease crown damage for model development.....	106
4.2.3 Spatial assessment of <i>Mycosphaerella</i> Leaf Disease.....	106
4.2.4 Image acquisition and pre-processing.....	108

4.2.5 Data analysis.....	109
4.3 Results.....	114
4.3.1 Observed spatial pattern of Mycosphaerella Leaf Disease damage.....	114
4.3.2 Model development to predict Mycosphaerella Leaf Disease severity	117
4.3.3 Map development.....	120
4.3.4 Image classification.....	120
4.3.5 Model validation.....	124
4.3.6 Classification accuracy.....	124
4.4 Discussion.....	129
<u>Chapter 5.</u>	
Towards precision forestry: the application of risk prediction models and remote sensing to the management of forest health	
5.0 Research outcomes.....	133
5.1 Forest health management: current and future trends.....	134
5.2 Mycosphaerella Leaf Disease management in the 21 <sup>st</sup> century.....	138
5.2.1 MLD risk prediction.....	139
5.2.2 Remote sensing technology for assessing MLD symptoms...	144
References.....	150
Appendix 1.....	178
Appendix 2.....	191
Appendix 3.....	205
Appendix 4.....	210
