Beyond e-Commerce: When Caterpillars Know What Butterflies Understand

Abstract

Many small firms increasingly operate in markets under siege from new entrants who exploit the technologies associated with the Internet's World Wide Web (the web). In these circumstances, interpreting the operating environment is like a *vu jàdé*, the opposite of *déjà vu*, a time in space where they have never been, have no idea what they are doing and who it is that could help them. Through the use of the story of the Caterpillar and the Butterfly, this paper considers the inherent difficulties faced by small firms considering the prospect of becoming an e-firm. When considered from an evolutionary perspective, the journey from small firm to small e-firm is not seen as one of choice, but rather one of necessity. In such markets, a race currently appears to exist between entrepreneurs exploiting the web's technologies, and the process of natural selection acting upon firms whose routines have lost favour.

Keywords: Small Firms, Evolutionary Theory, and The Internet

Introduction

The 'e' prefix has seemingly come to symbolise the information revolution. But does it change all manner of thinking, or, is it simply just the fifth letter of the alphabet? Despite claims to the contrary that e-business is nothing more than just business (Porter, 2001), the 'e' has been widely associated with anything and everything related to the Internet's ubiquitous World Wide Web (the web). There appears widespread consensus that the web has forever changed the business environment (Sawhney & Zabin, 2001). This environmental change has impacted certain industries (e.g. banking, stockbroking, bookselling and auctioneering) at a greater rate than others, but increasingly permeates all industries to some degree. The

unprecedented scale and speed of the web's growth has caught many firms off guard. An inability to adapt to the changing business environment may, in many cases, lead to a break in the fit between the environment and the firm's routines and competencies, a maladjustment (Santos, 2002). Such maladjustment may act to ignite attempts to adjust this fit internally, or, result in the demise of the firm due to an inability or unwillingness to adjust routines and competencies.

This paper considers the difficulties faced by small place-based firms operating in fast changing web-impacted environments. The terms small place-based firms and web-impacted environments (Jones & Hecker, 2003) define firms with operations historically determined by and confined to a specific geographical location (e.g. bookshops), and environments characterized by new innovative entrants (e.g. Amazon.com) who use the web's technologies to provide unprecedented and unique consumer value. In this context, small refers to those firms in product and services markets, with typically less than twenty employees. Under such circumstances, it is the ability of the firm to proactively seize opportunities, rather than merely try to survive (Godin, 2002) that is of most importance.

Classifying the 'e'

With the 'e' not yet returned to its rightful place as the alphabet's fifth letter, lessons are beginning to emerge as to the significance of its recent use as a descriptor of all things related to the information revolution. Firstly, e-commerce and e-business do not mean the same thing. E-commerce can be defined as "technology-mediated exchanges between parties (individuals, organizations, or both) as well as the electronically based intra- or interorganizational activities that facilitate such exchanges" (Rayport & Jaworski, 2001:3). In contrast, e-business can be thought of as "the use of electronic networks and associated technologies to enable,

improve, enhance, transform, or invent a business process or business system to create superior value for current or potential customers” (Sawhney and Zabin, 2001:15). The distinction between the two is emphasised when consideration is given to the major disparity between small firms connected to the web and those actually using it to take orders and receive payments (Yellow Pages Business Index, 2002).

The suggestion is that in web-impacted environments, e-business represents a major change. Within such environments the routines and competencies of existing firms must adapt to meet the needs and wants of current and potential customers to ensure a fit between the firm and its operating environment. Therefore, the term ‘small e-firm’ is used to refer to those small firms whose e-activities are transformational and go beyond mere generic technology-mediated exchange of an informational nature. Alternatively, the term ‘quasi small e-firm’ is used to mean those small firms connected to the web but who have not transformed existing activities to create new web-based value for both firm and customers. They are therefore in limbo between a state of e-commerce and e-business. These distinctions are critical to furthering our understanding of why some small place-based firms succeed where other fail in their efforts to change with the times. This paper proposes that a small firm’s journey from adopting e-commerce to conducting e-business appears to have some similarity with the story of the “Caterpillar and the Butterfly” (Köhe’t, 2003).

Unavoidable, but Unexplained Destinations

For many quasi small e-firms, web-impacted environments perhaps represent a *vu jàdé* (Weick, 1993), the opposite of *déjà vu*, a time in space where they have never been, have no idea what they are doing and who it is that could help them. So, is it likely small place-based firms will successfully transform their operations in web-impacted environments, or will the

environment's exogenously generated change result in their demise? The story of the caterpillar and the butterfly emphasises a new paradigm of thought required by small firm owners. Just as a caterpillar must endure a painful metamorphous to become a butterfly, small firms must radically transform their goals, boundaries and activities (Aldrich, 1999) to be transformed into an e-firm. The story offers a syllogism for thinking about the challenges confronting the small firm attempting to adapt within a hostile business environment through the development of e-business activities.

The caterpillar spent most of his existence struggling to survive, and only thinking of his immediate needs. The caterpillar struggled for existence against many predators, and the caterpillar was unable to see past the few leaves in front of him. The caterpillar could not imagine what it would be like to be a butterfly soaring in the wind, and see the beauty of everything around him.

Small firms typically exhibit a short-term focus, with cash flow a strong determinant of their immediate focus (Carson, 1998). Given the difficulties of quantifying probable future cash flows from e-business, it is perhaps understandable why such short-term thinking may apply to the web. Not surprisingly it has been the easy to reach 'leaves' (e.g. email and information searching capabilities) that appear attractive to many small firms adopting the web. However, such change does not constitute a transformation. A transformation is determined by the scope and depth of the change across the firm's goals, boundaries and activities (Aldrich, 1999). A failure to look beyond the short-term could condemn the quasi e-firm to ignorance of what the web could contribute to the firm. The assumption is that the quasi e-firm has yet to develop a vision of what may occur. This is understandable given the propensity of established firms to

develop deeply entrenched mental models that cloud their view of what the future could be (Sawhney & Zabin, 2001).

Could the caterpillar really imagine what his new existence would be like? If the caterpillar told the other caterpillars what was going to happen, most of the other caterpillars would think the caterpillar was going insane. Most of the other caterpillars could not even begin to conceive that what they were told was possible. Would any of this mean that what was going to happen to each caterpillar was not real? Would it simply mean that the other caterpillars were not ready to know the truth?

Small firms are less likely to have the degree of resources and individual power in comparison to the larger firms within their industry. Carson and Gilmore (2000) note that in addition to these limitations, small firms also typically rely upon experiential learning to develop their knowledge base. The founding and development of small firm operations are typically derived from reproducing existing and observable operational forms, rather than creating new ones (Aldrich & Kenworthy, 1999). A potential down side for many small firms is an inability to truly sense the degree and nature of change that surrounds their enterprise. Unlike the innovator, who is prone to experimentation and challenging existing best (or normal) practice, the reproducer is largely reliant upon other firms to develop new knowledge. It is proposed that in the absence of firm capabilities that support the acquisition, assimilation, transformation and exploitation of external knowledge, defined as absorptive capacity by Zahra and George (2002), small place-based firms will be at the mercy of the gales of creative destruction (Schumpeter, 1934) that threaten to selectively remove ignorant quasi e-firms from web-impacted environments.

Absorptive capacity, as defined by Zahra and George (2002) has four dimensions, the acquisition, assimilation, transformation and exploitation of knowledge. These four dimensions allow discussion of the specific firm processes that would typically influence the potential adaptation of a firm. Two subsets, potential absorptive capacity and realized absorptive capacity host the four dimensions. Potential absorptive capacity (i.e. acquisition and assimilation) is the capability to sense what information is relevant, acquire it, analysis it, comprehend it and internalise. Realized absorptive capacity relates to the routines that blend existing knowledge with newly acquired knowledge to gain new insights to opportunities or problems and provide structured pathways to develop new competencies (i.e. transformation and exploitation). This complementary process of exploration and exploitation represents advanced learning behaviours that are not commonly associated with the typical reproducer type small firm.

However, without such learning capabilities, the knowledge base of the quasi e-firm is likely to be inadequate for exploiting of the web's technologies. Rogers (1995) states that complex innovations (e.g. the web) depend upon know-how knowledge (e.g. information necessary to fully exploit the web) and principles knowledge (e.g. information relating to the web's theoretical underpinnings) to fully exploit the innovations potential. In the absence of such vital knowledge, firms would be likely to conform to industry norms. Under such circumstances, the firm would be expected to continue the role of reproducer (rather than innovator) of current business practices. Unfortunately, the web is a real phenomenon; it is changing the very way business is conducted with firms unable to adapt to its new rules inevitably naturally selected from their operating environments.

When the caterpillar first created his cocoon, the caterpillar did not know what was happening. The caterpillar was still attached the caterpillar's old world, but the caterpillar was no longer a part of the caterpillar's old world. The caterpillar was closed off from the caterpillar's old world, but the caterpillar was not ready to enter the caterpillar's new world. The caterpillar constructed his cocoon from all of the accumulated rubbish from the caterpillar's existence. This is what the caterpillar must discard before the caterpillar can become the butterfly.

A basic question exists; does the web represent evolution or a revolution to the typical small place-based firm? This question is perhaps best answered with reference to Bach's (1994) notion that, *what the caterpillar calls the end of the world, the world calls a butterfly*. Thus, viewed from the quasi-small e-firm's perspective, it would seem revolutionary. However, when viewed retrospectively by the small e-firm it may seem an evolutionary process dependent upon self-discovery. Perhaps, a key determinate enabling the quasi small e-firm to avoid the unrelenting forces of natural selection is that of vision. Unlike the biological process that the caterpillar will endure, the small quasi e-firm (in web-impacted environments) must overcome obstacles to exploiting the web or be subject to the vagaries of maladjustment with their operating environment.

An example of such an obstacle is the changing and unpredictable nature of consumer behaviour associated with the web. In comparing consumers to the mythological Greek centaur, Wind, Mahajan and Gunther (2002) suggest that consumer behaviour has forever been altered by the emergence of the web. Consumers it seems, will choose from the web what improves their lives, and leave behind what does not. The consequences of such change in consumer behaviour are the difficulties that occur in segmenting markets based on

observable and stable preferences. The small place-based firm's advantage of closeness to its customers is lost, as the unstable metamorphous consumers undergo between traditional consumer and cyberconsumer occurs largely via the privacy of the consumer's interface to web.

The metamorphous which the caterpillar must undergo to transform from caterpillar to butterfly is very painful, but unless the caterpillar endures the metamorphous, the caterpillar cannot become the butterfly. The caterpillar has no idea what to expect...as the metamorphous progresses, the caterpillar slowly starts to understand what is happening. However, the caterpillar has difficulty believing what is occurring, despite the wings which are forming.

For the quasi small e-firm, this process requires a vision of what path the firm should pursue and what existing routines and competencies will not support this journey. Such evaluation is dependent upon the direction, speed and intensity of the firm's efforts to acquire external knowledge (Zahra & George, 2002). The web can be viewed as an activation trigger that compels small firms to seek information from which to determine the most appropriate response to the changing environment. Firms that possess potential absorptive capacity (i.e. the acquisition and assimilation of external knowledge) would seem to have an increased ability to make sense of complex environmental change (Kim, 1997). Such high-level routines would be practised at identifying which external knowledge is critical to improving firm performance. These routines would enable external knowledge to be analysed, interpreted and its contextual value determined. However, the presence of potential of absorptive capacity does not predicate the ability to successfully transform and exploit knowledge (Zahra & George, 2002). Therefore, while the firm may acquire and attempt to assimilate external

knowledge, the selection of new routines that maintain or increase fitness vis-à-vis the operating environment is dependent upon the transformation and exploitation of external knowledge. Therefore, the firm's ability to adapt is dependent on the complementary relationship between potential and realized absorptive capacity.

The successful reconstruction of the firm's knowledge base (i.e. the transformation of knowledge) through combining new and existing knowledge provides the basis for realizing the firm's absorptive capacity through the development of new competencies (i.e. the exploitation of knowledge). Clearly, such a capability presumes a degree of curiosity by the firm to explore its operating environment. Therefore, it is proposed that small place-based firm exploitation of the web is dependent upon the development of different knowledge bases, typically from new knowledge sources. In the likely absence of new knowledge, exploitation of the web is limited by the technological paradigm within the firm (Dosi, 1984) that governs the normal patterns of problem solving or opportunity exploitation. Such paradigms may cause exclusion effects that prevent exploitation of the web through ignorance of the extent of technological possibilities. Given that small firms typically have less internal resources at their disposal to evaluate environmental threats and opportunities (Lang, Calantone & Gudmundson, 1997), reliance upon external sources may be intensified.

However, little evidence exists to suggest that small firms are actively pursuing knowledge with regards exploiting the web (Chau & Lawrence, 1998). This is perhaps due to the resource constraints of knowledge, time and capital (e.g. Vescovi, 2000; Chaston, Badger, Mangles & Sadler-Smith, 2001; Plume, 2001; Jones, Hecker & Holland, 2002; Van Beveren & Thomson, 2002). Further compounding this issue is the difficulties small firms may face in locating technology linkers who understand how their core activities relate to web-based

opportunities and guide their exploitation (Plume, 2001; Jones et al., 2002). Under such circumstances the web, despite being a source of new variation and a catalyst to altering the existing internal selection criteria (Aldrich, 1999), may also pose a threat. That is, existing internal selection processes may promote persistence rather than change. In such situations small firms could become stymied, unable to adequately understand variations and ignorant of external environmental selection forces.

Regardless of how hard the butterfly tries, the butterfly cannot possibly fly until the butterfly first discards the cocoon. Before the butterfly can fly, the butterfly must force it's way out of the cocoon, which takes some effort.

It is the quasi e-firm's lack of vision and understanding of what the web could be that must be overcome to enable transformation. Penrose (1959) suggests that an imbalance between embodied technology (e.g. the web's hardware) and disembodied technology (e.g. know-how of the web) would prove detrimental to optimally developing new technologies. The suggestion is that while the web is available to all firms in the market, it is only those firms with the knowledge-based resources to exploit its potential that will profit from its acquisition. Or as Veblen (1919:71) states, "the physical properties of the materials accessible to man are constants: it is the human agent that changes, - his insight and appreciation of what these things can be used for is what develops". Again it is the dependence upon knowledge that governs the evolution of the quasi small e-firm. However, the ability to develop potential absorptive capacity may be limited by a lack of prior knowledge (Cohen & Levinthal, 1990) related to the web. Consequently, increased complexity of learning may result in firms struggling to acquire, comprehend and implement knowledge associated with new routines and competencies (McKelvey, 1982).

When the routines and competencies of other web-based entrants remain imperceptible through geographical, technical and legal barriers, decreased exposure to variations may restrict the firm's ability to change. This is because the firm must bridge the knowledge gap between what is known and what is not, through difficult to acquire and assimilate (and therefore difficult to transform and exploit) foreign knowledge bases. It is also possible that routines imprinted into firms (Tucker, Singh & Meinhard, 1990) prior to the emergence of the web may not support the learning behaviors required to adapt to the web. Many existing small firms are experimenting with varieties of web applications. However, the process of experimentation reduces the potential efficiency of existing routines and does not guarantee development of an appropriate e-business model. To date, a dominant design for place-based firms successfully conducting exchange on the web seems elusive.

Tushman and Murmann (1998) note new dominant designs (i.e. e-business models) are dependent upon patterns of variation, selection and retention at the subsystem level that ultimately effect firm and industry change. Given the resource poorness of many small firms, identification of a particular business model that will be both efficient and effective is a major challenge. Also, the volume of web-based exchange in many industries is still relatively low restricting the observability of variations upon which new dominant designs are conditional. Again, the absorptive capacity capability is deemed of importance given that dominant designs are only known in retrospect and then only after only they account for over 50% of exchange against competing designs (Anderson & Tushman, 1990). This suggests that the process of learning will be difficult for small quasi small e-firm operating in web-impacted environments. While effective entrepreneurs are considered to be exceptional learners (Smilor, 1997), the distribution of effective (innovative) entrepreneurs in any given population of firms is however typically low (Aldrich & Kenworthy, 1999). Therefore, it

would seem that the emergence of active small e-firms represents a triumph of knowledge development capabilities.

One day, the butterfly breaks out of it's cocoon and soars off into it's new world, leaving an empty shell behind. The butterfly recalled that he had worried about which caterpillar had the juiciest leaf, and whether the leaves would always be there. The butterfly now saw trees and knew that there were other trees. The butterfly could not understand why he had believed that the insignificant leaves on a single tree had been so important. However, without those insignificant leaves, the caterpillar could not have sustained itself, and grown to become the butterfly.

The small e-firm is identifiable by the transformation that has occurred across its goals, boundaries and activities. The extent and nature of the change should be reflected in the firm's value proposition, with both existing and future customers' needs addressed. In essence, the value proposition is anchored by the firm's past and determined by the firm's vision of the future. The value proposition represents the total value appropriated by the firm, its customers and any other participants involved during transactions (Brandenburger & Stuart, 1996; Amit & Zott, 2001). A critical distinction between the quasi small e-firm and the small e-firm is that while e-commerce delivers immediate value to the quasi small e-firm (e.g. reduced communication costs and efficiency in acquiring information), it does not provide the foundational value required to support e-business. The small e-firm harnesses the web's interactivity and connectivity to go beyond simple internal efficiencies and exploit 'trapped' value (i.e. value gained from market and value system efficiencies) and/or 'new-to-the-world' value (i.e. new value through customisation and personalisation) (Rayport & Jaworski, 2001).

The customer relationships that have sustained the quasi small e-firm during its pre-web history perhaps hold the key to the development of a sustainable value proposition. Until the technologies associated with the web are employed to meet the discovered needs and wants of a target segment/s, the quasi small e-firm's transformation will remain incomplete. Despite the pervasive claims by many marketing theorists that such discovery is reliant upon traditional market-oriented behaviours (e.g. Hoffman & Novak, 1997; Lodish, Morgan & Kallianpur, 2001), little evidence exists to support the continuation of such a prescriptive approach. In fact, Connor (1999) and Wrenn (1997) note that where radical technologies significantly alter market conditions, the ability of consumers to articulate their latent needs is very questionable.

Wrenn (1997) proposes a new way of thinking about the traditional market orientation (see Kotler, 1997). Wrenn suggests that typically, assumptions are made that customers can always express their needs. The role of marketing is seen to be one of interpretation and the provision of a product or process driven solution. He proposes that under conditions of technological uncertainty, the role of marketing must also be that of mediator between the customer and the available technology. This suggests that the firm must have or develop a vision of what could be in order to translate potential technological attributes in possible customer benefits. Wrenn's 'reality based market orientation' thesis is challenging to mainstream marketing theory due to its suggestion that firms may experience difficulty relying upon generic linear frameworks to strategise. It requires firms to revisit their past in order to discover their future trajectory.

The butterfly lands on the flower of a tree. The same tree the butterfly had lived on as the caterpillar. The butterfly carries pollen to another flower, to fertilise the seed, which will fall to the ground and grow into a tree for caterpillars to live on.

The transformation of quasi small e-firms into a small e-firm provides tangible evidence to other quasi small e-firms seeking to adapt to web-impacted environments. At present, the cognitive legitimacy (Aldrich, 1999) that surrounds optimal small e-firm business models is limited. The emergence of observable and perhaps imitable organizational forms provides a vital source of variations for populations and broader communities of firms to consider. Given that the transformation of a firm “involves a major change in an organization over time and represents a substantial variation, planned or unplanned, that has been selected and retained” (Aldrich, 1999:194), the presence of successful small e-firms is crucial to both reproducers and innovators. The suggestion is that the small e-firms “that survive are replicated, diffuse through the population and become the predominant type” (Ziman, 2000:4).

This paper has adopted a Lamarckian evolutionary view that “organizations exist in environments and are responsive to environmental forces” (McKelvey, 1982:242). From this perspective, small e-firms have been capable of identifying specific niches that promote the value of their physical assets, using the web’s reach to enter new markets, or a combination of both. It has also been noted that despite a small quasi e-firm’s deliberate intention to consider new variations, external selection pressures may in the event of maladjustment, prevent transformation occurring (Grant, 1985; Amburgey, Dacin & Kelly, 1994; Santos, 2002). Lamarckian evolution, the acceptance of “both the inheritance of acquired characteristics and the timely appearances of variation under the stimulus of adversity” (Nelson & Winter, 1982:11), represents a purposeful evolutionary process (within the firm) whose outcomes are

governed by the external evolutionary process of natural selection (Knudsen, 2003). Hence, while the firm's routines can be altered via Lamarckian evolution, neo-Darwinian evolution (i.e. natural selection by the operating environment) provides the final judgement on the fitness of the routines with respect the operating environment. The challenge clearly lies in appreciating that in web-impacted environments, e-business is an unavoidable extension of e-commerce, not an alternative choice. In combination, the changing nature of an industry and its carrying capacity (Aldrich, 1999) ensure that organizational forms without fitness (vis-à-vis the operating environment) are naturally selected out of specific industries.

How many centuries did it take for us to discover that the caterpillar and the butterfly were the same entity? We spend most of our lifetimes like a caterpillar struggling to survive, and only thinking of our immediate needs. The metamorphous which we must undergo is extremely painful, but unless we endure the metamorphous, we will remain as caterpillars.

The Consequences of Change

If e-business will eventually be just business, why should we seriously consider new ways of thinking about the changing nature of the small firm? The answer is straightforward. The impending return of the 'e' to the alphabet signifies the cognitive and sociopolitical legitimacy (Aldrich, 1999) that increasingly surround e-business. It signifies the legitimacy of the organizational structures and practices that support the exchange of value between consumers and small (and large) e-firms. It is through the evolutionary processes of variation, selection, and retention that new routines and structures emerge victorious. Observation and knowledge of these prosperous behaviours provides a specific pathway for many quasi small e-firms and new entrants to follow. The use of evolutionary theory throughout this paper

serves to illustrate how such diffusion might occur. “Evolutionary theory unites in a single coherent framework a concern for the entrepreneurial outcomes and the processes and contexts making them possible.” (Aldrich & Martinez, 2001:42). This approach provides a critical view of the variations that support new enterprise and adaptation within web-impacted environments, and the circumstances (both internal and external to the firm) that lead to the selection and retention of new business practices.

This process of viewing the changing nature of small firms requires appreciation of the organizational hierarchies (Baum & Singh, 1994) that support and influence evolutionary change. Attention to the nested nature of multiple levels of interaction (e.g. individual, firm, population of firms, community of populations, and the ecosystem that surround them) provide awareness of the high-level routines required to successfully adapt within web-impacted environments. If, as it appears, small firms (in general) are experiencing difficulty developing awareness of and gaining appreciation of variations in new business models, the development of potential absorptive capacity represents a significant starting point. Comprised of knowledge acquisition and assimilation capabilities, potential absorptive capacity provides the gateway to internalising and comprehending external knowledge for complex innovations such as the web. A clear challenge remains for those firms whose histories are without experience with web-like technologies. To move beyond a potentially inadequate technological paradigm, boundary-spanning behaviours of inquiry must be present. However, in the absence of persons whom adequately perform the role of technology linker to small firms, the owner/manager must act in this capacity by default. In the absence of such reflection, existing firm knowledge may ensure the replication of current practice, and therefore block out consideration of new variations from which possible adaptation is possible.

At present, it would seem that many small firms are trapped in a cocoon of their own making, unable to visualise what heights they could soar to. During this elongated period as a quasi small e-firm, the small place-based firm is increasingly susceptible to external forces of selection that are beyond their control. The development of a value proposition that satisfies both current and future customers is conditional upon the selection of new routines. Therefore the quasi small e-firm must be exposed to external knowledge to ensure awareness of and enlightenment from the variations that may provide an increased fit with the changing environment. The alternative, the continuation of ignorant practices that endanger the future prosperity of the quasi small e-firm.

Conclusion

The story of the Caterpillar and the Butterfly” (Köhe’t, 2003) provides an interesting way to view the learning challenges confronting small place-based firms operating in web-impacted environments. Unlike the caterpillar, a biological process does not control transformation to small e-firm. The role of learning is central to exploring and exploiting specific external knowledge to bring about change across the firm’s goals, boundaries, and activities. The construct absorptive capacity has been considered as a mechanism through which such learning may occur. However, its development is predicted to be problematic due to a lack of prior knowledge related to the web’s technologies. Given the propensity of most small firms to be reproducers, rather than innovators (Aldrich & Kenworthy, 1999), evolutionary theory has been used to introduce a new perspective. As such, the evolutionary potential of quasi small e-firm is considered to be a product of its ability to sense and respond to environmental shocks through the acquisition and exploitation of specific external knowledge. In the event that these learning capabilities do not exist, the quasi small e-firm is largely dependent upon copying observable business model variations introduced by other small e-firms.

This suggests that within web-impacted environments, a race exists between entrepreneurs who employ a heuristic-based logic (Alvarez & Busenitz, 2001) to simplify environmental uncertainty and the process of natural selection acting upon any firm whose routines have lost favour. The danger in web-impacted environments for quasi small e-firms is that the change in behaviour required to address the nature of the changed environment is typically made “only tardily and reluctantly, and only under coercion exercised by a situation which has made the accredited views untenable” (Veblen, 1925:192). That is, the degree of maladjustment has become apparent to the firm’s owner with the web viewed as a threat, rather than an opportunity. What appears required is for the small place-based firm to behave like a caterpillar that is fully aware of what lies beyond its cocoon. Therefore, a vision connected to the web’s technologies (or of an alternative non-technological response) would appear a necessity to safeguard the quasi small e-firm’s future.
